A microwave oven is a great cooking device that is used for a wide range of cooking techniques. It takes a great variety of shapes and sizes for even a wide range of cooking techniques. The biggest problem with a microwave oven is that it is hard to use, and even harder to clean. Microwave ovens usually are designed to heat food from the outside to the inside, and therefore the food has the texture of a baked good. Having the foods texture baked in the oven doesn't help when you are cleaning it. Cleaning the inside of the oven with a sponge is nearly impossible, plus, the sponge doesn't hold water very well. Microwave ovens usually have a pair of racks that run in parallel inside the oven. The racks are spaced apart within the oven so that the food being cooked is placed on the racks to ensure even heat distribution. Most microwaves are approximately a foot long and about half as tall. Because the height of the oven is about half of the foot, there are a lot of empty space above the food being cooked that is not heated by the microwaves. An open bottom design is most common. The open bottom design is commonly used because it has a shorter cooking time than other designs. This makes the cooking time more efficient, and therefore means less food has to be prepared at once. Microwave ovens are used for cooking many types of food including frozen food, pizza, popcorn, and more. Microwave ovens usually include a timer that is preprogrammed to cook food for the indicated length of time. Microwave ovens typically come equipped with convection heating. Convection heating adds more heat to the food being cooked. This is done with a fan that circulates heat throughout the oven. The problem with the convection heat setting is that the fan produces a great deal of noise. If food is cooking at the convection heat setting for too long, the fan on the microwave will run continuously. This will eventually damage the fan or the blades.antos, and J. I. Cirac, Phys. Rev.
